Preface

This book is designed as an easily accessible and useful practical guide to getting started with the statistical software tool R for applications in Finance & Economics. There are various open source or commercial software packages available for statistical computing. R is not just used for statistical modelling in business analysis, socio-economic analysis etc., but is also gaining popularity among students and researchers in academia in the fields of Economics and Finance. R is currently one of the most popular software packages available. Its popularity is partly driven from the fact that it is a free resource for users and its great versatility in a variety of applications. The unique strength of R is that it has a multidiscipline base with packages being supplied from a wide spectrum of disciplinary contributors from science, mathematics, computing and operational research, plus a broad spectrum of the social sciences.

The design of this book has been greatly influenced by introductory courses in R that have been run by the authors both at Edith Cowan University in Western Australia and in the Edinburgh Business School at the University of Edinburgh in Scotland. In these courses it was found that beginners have considerable difficulty in setting up R and Rstudio, in the importation of data, and in the writing of code. The book addresses these issues in a simple to understand, comprehensive way that the more advanced books available on R do not. Yet these courses were run for postgraduate students and university staff members, but most seemed to struggle at first.

This book is specifically targeted towards early career researchers or research students who have some exposure to basic statistical methods used in quantitative research. Although the first author of the book has over eight years of computer programming experience and over four years of experi-

ence with R, the text is designed in such a way that people with even limited knowledge of computer programming can benefit. The second author's experience with computing stretches back to working with mainframes, in the late 1970's, at the University of Edinburgh in Scotland, before switching to personal computers in the 1980's at the University of Western Australia. The bulk of his more recent research experience in finance and econometrics was with menu-driven econometrics programs. He did not have exposure to Matlab and subsequently R until he was in his sixties. This reinforced his awareness of the importance of appropriate data import, formatting, and manipulation. The intention is to make this book useful for people with computing experience as little as recording a macro in MS-Excel up to writing codes in C++/MATLAB/R/S or other programming languages.

"R in Finance and Economics-A Beginner's Guide" provides an introduction to the statistical software R and its application with an empirical approach in finance and economics. We believe that the methods and procedures outlined in the book are likely to be of use to researchers from various fields beyond the ones of focus here. The major objective of the text is to get the reader started with R by making the reader familiar with the concepts and techniques required. We do not develop any R package via this book but use various packages which are available and are useful for research to sustain the applied nature of this text. The easy to follow text, provides examples and applications of econometric and statistical analysis techniques to central methods in economics and finance.

The book cover topics ranging from introduction to R environment to advanced topics like multivariate Vine Copulas. Chapter-1 provides an introduction to R and overview of RStudio interface which is the primary R GUI/IDE used in the book. Chapter-2 discusses some of the most common data types and structures used in statistical analysis using R followed by various methods to import, export and pre-process external data in Chapter-3. Chapter-4 provides a brief overview of some important programming concepts including program control flow and creating functions. Almost all empirical problems in Finance and Economics require a robust preliminary data exploration with summary/descriptive statistics and exploratory plots which is discussed in Chapter-6. R is gaining popularity among data analytics community not just because of its statistical prowess but also due to advanced data visualisation capabilities. Chapter-7 discusses various methods available to create various types of graphs in R including a short introduction to the *ggplot2* package.

Chapter-7 and chapter-8 present Regression Analysis; one of the most

widely used tools in quantitative methods. Chapter-7 provides an overview of linear regression (OLS) and Quantile Regression along with an empirical example illustrating the use of linear regression to evaluate multifactor models in finance. Panel Regression and Logistic Regression are two other statistical tools used in empirical finance and economics along with OLS and Quantile Regression. We discuss these two regression tools in Chapter-8 and provide an illustrative example on how to use Panel Regression in applied economic problems. After regression analysis, chapter-9 provides an overview of widely used Autoregressive and conditional autoregressive time series models in Financial econometrics. We also discuss an example on modelling and forecasting Value at Risk (VaR) using GARCH model in R.

Chapter-9 introduces Extreme Value Theory (EVT), which is used in risk quantification in finance and actuarial studies. We discuss EVT for financial risk and EVT for bivariate tail dependence along with an empirical example. The last chapter, chapter-10 of the book focusses on multivariate dependence using Copulas. Chapter-10 presents some widely used bivariate copulas and also introduces the recently developed multivariate Vine-Copulas, which are more flexible than bivariate copulas. The example in chapter-10 demonstrate how to estimate portfolio VaR using Vine-Copulas.

The book is designed with due consideration for the difficulties which a beginner programmer can face. The text contains illustrative examples and code is provided in the text itself. The examples are reproducible using the open source R and Rstudio programs. The following are the key strengths of this book:

- (1) Short and Concise: The book will follow a minimalistic approach in teaching how to use R. The discussions will focus primarily on easy to follow methods and which are mostly used by beginner and intermediate users. There will be a discussion for more advanced users but that will be included in separate chapters.
- (2) Easy to follow: The contents in the book will be kept to the level of a beginner or intermediate R user so it will be easily understood also by early career researchers and research students (PhD, Masters by Research etc)
- (3) Examples: Every method explained in the book has a detailed following example with tips and tricks. The code used for the example is given in the book itself so that the user can copy it to reproduce the results (when using an ebook).

- (4) Reproducible Codes: R codes (scripts) will be provided for all the chapters in the book.
- (5) Practical applications: Research based examples are included which will include the most widely used statistical and econometric applications such as linear regression, econometrics (GARCH etc). This will enable beginners to get started and produce sound results. These examples will include applications to similar problems as addressed in the research papers by the authors of this book and thus will be current and state of the art.
- (6) Reproducible Research: The examples and case studies in the book will follow step by step procedure which will enable to reproduce them. The data is provided with the book on its companion website. **Insert url here**

To summarise, the book demonstrates the latest research methods in finance and economics with applications featuring linear regression, quantile regression, panel regression, econometrics, Extreme Value methods and copulas using a range of data sets and examples.

A. K. Singh & D. E. Allen

Contents

<i>Preface</i>	i
1. Introduction	1
1.1 Why should we learn R?	2
1.2 R-Getting Started	3
1.2.1 Installing R on Windows	3
1.2.2 RStudio- A better way to do run R	4
1.2.3 Installing RStudio for Windows	5
1.2.4 RStudio GUI/IDE	5
1.3 Proxy Setup	5
1.4 R Packages	8
1.4.1 Installing Packages	8
1.5 R core packages	9
1.6 Task Views in R-Introduction & Installation	11
1.7 Getting Help	12
1.7.1 Getting help from the web	14
1.8 Summary	14
2. Data Objects in R	17
2.1 Introduction	17
2.2 Data Types	17
2.2.1 Double	18
2.2.2 Integer	18
2.2.3 Complex	19
2.2.4 Logical	19
2.2.5 Character	19

2.2.6	Factor	20
2.2.7	Date & Time	20
2.2.8	Missing Data in R	22
2.3	Data Structures in R	22
2.3.1	Vector	23
2.3.2	Matrices	23
2.3.3	Arrays	27
2.3.4	Data Frames	27
2.3.5	Lists	29
2.4	Summary	31
3.	Data Handling in R	33
3.1	Introduction	33
3.2	Importing and Exporting Tabular Data in R	33
3.2.1	Reading Data from a Text File	33
3.2.2	Reading Data from CSV File	36
3.2.3	Reading Data from Excel Files	37
3.2.4	Reading Data from Databases	37
3.2.5	Reading from Data Files from other Statistical Systems	37
3.3	Data Preprocessing in R	41
3.3.1	Extracting Data	41
3.3.2	Combining Data Frames	43
3.3.3	Sub-setting and Logical Data Selection	45
3.4	Summary	47
4.	R Programming & Control Flow	49
4.1	Introduction	49
4.2	Control Flow	50
4.2.1	if-else Conditional Statements	50
4.2.2	Using switch	51
4.2.3	Loops	52
4.3	Functions in R	54
4.4	Summary	56
5.	Data Exploration	57
5.1	Introduction	57
5.2	Summary Statistics	57

Contents

vii

5.3	Example-Descriptive Statistics of Stock Returns	65
5.3.1	Introduction	65
5.3.2	Importing the Data	66
5.3.3	Some basic plots	77
5.4	Summary	81
6.	Graphics in R	83
6.1	Introduction	83
6.2	Basic Plots in R	84
6.3	Exporting Graphics	97
6.4	R Graphical Parameters	98
6.5	Introduction to ggplot2	103
6.5.1	Getting started with <code>qplot</code>	103
6.5.2	Layered graphics using <code>ggplot</code>	105
6.6	Transforming data from wide to long format	112
6.7	Summary	114
7.	Regression Analysis-I	115
7.1	Introduction	115
7.2	OLS	115
7.3	Quantile Regression	121
7.3.1	Estimating QR	123
7.4	Example-Fama French Factor Model and Multiple Regression	128
7.4.1	Introduction	128
7.4.2	Data	130
7.4.2.1	Data Preprocessing	130
7.4.3	OLS Regression Analysis of the Fama-French Three Factor Model	135
7.4.4	Quantile Analysis of the Fama-French Three Factor Model	138
7.5	Summary	143
8.	Regression Analysis-II	145
8.1	Introduction	145
8.2	Panel Data Linear Regression	145
8.2.1	Fixed and Random effects using the <code>plm</code> package .	147
8.2.1.1	Fixed Effect Estimation	148
8.2.1.2	Random Effect Estimation	150

8.2.1.3	Panel or OLS	151
8.2.1.4	Fixed Effect or Random Effect	153
8.3	Logistic Regression	153
8.4	Example-Economic Growth and Unemployment A Panel Analysis	156
8.4.1	Data and Methodology	157
8.4.2	Data Preprocessing	157
8.4.3	Linear Panel Regression Analysis	160
8.5	Summary	166
9.	Time Series Analysis	167
9.1	Introduction	167
9.2	Time Series-Some Properties	168
9.2.1	Stochastic Process	168
9.2.2	Stationarity	169
9.2.3	Autocorrelation Function (ACF)	171
9.2.4	White noise	173
9.3	Autoregressive Moving Average Model (ARMA)	174
9.3.1	Fitting an ARMA model	175
9.4	Volatility Modelling using GARCH	181
9.4.1	Fitting a GARCH(1,1) model using the <i>rugarch</i> package	182
9.5	Example-Modelling and Forecasting daily VaR using GARCH	190
9.5.1	Data & Methodology	191
9.5.2	VaR Forecasts	193
9.6	Summary	198
10.	Extreme Value Theory Modelling	199
10.1	Introduction	199
10.2	EVT and Financial Risk Modelling	199
10.2.1	GPD and POT Method	201
10.2.1.1	Sample Mean Excess Plot	202
10.2.1.2	Estimation of GPD	205
10.2.1.3	VaR and Expected Shortfall	207
10.3	EVT and Tail Dependence	211
10.3.1	Measures of Tail Dependence	212
10.3.1.1	Asymptotic Dependence - The Conventional Approach	215

Contents

ix

10.3.1.2 Asymptotic Independence- An Alternative Measure of Dependence.	215
10.3.2 Estimating χ and $\bar{\chi}$ - Nonparametric Method	218
10.4 Example-EVT VaR-A Dynamic Approach	221
10.4.1 Data & Methodology	222
10.4.2 VaR Forecasts using Dynamic EVT Model	224
10.5 Summary	226
11. Introduction to Multivariate Analysis using Copulas	227
11.1 Introduction	227
11.2 Copula	228
11.2.1 Types of Copula	229
11.2.1.1 Elliptical Copulae	229
11.2.1.2 Archimedean Copulae	235
11.2.2 Copula Selection	240
11.3 Multivariate Vine Copulas	241
11.3.1 Estimating R-Vine Copulas Using R	242
11.4 Example- Portfolio VaR Estimation Using Vine Copula . .	249
11.4.1 Data & Methodology	249
11.4.2 VaR forecasts using R	250
11.5 Summary	255
